# **Encephalitis Update**

# ► **Viral Meningitis and Encephalitis Update**

► **Boris Garber<sup>1</sup> · Johnathan Glauser<sup>2</sup>**

► Accepted: 2 May 2024 / Published online: 14 May 2024

► © The Author(s) 2024, corrected publication 2024

A dark grey arrow points to the right from the left edge of the slide. Several thin, curved lines in shades of blue and grey originate from the left side and sweep across the slide towards the text.

# Encephalopathy

altered consciousness lasting for more than 24 hours including lethargy, irritability or a change in personality or behavior

per se can complicate many serious systemic infectious and inflammatory conditions, can result from local or systemic circulatory issues, or it can be a sign of degenerative brain disorders.

# Encephalitis

- **The International Encephalitis Consortium:**
- encephalopathy for 24h plus two of the following:
  - 1) fever;
  - 2) seizures;
  - 3) focal neurological findings;
  - 4) CSF (cerebrospinal fluid) pleocytosis;
  - 5) characteristic brain MRI or electroencephalogram (EEG) findings.

# cause of encephalitis

- unknown in over half the cases despite extensive diagnostic workup

A dark grey arrow points right from the left edge of the slide. Below it, several thin, light blue lines curve upwards and to the right, creating a decorative graphic element.

► Fortunately, incidence of **bacterial meningitis** has been **decreasing**

due to ;

effective target **immunizations**

# Aseptic meningitis

- ▶ is a somewhat misleading term for meningeal inflammation from causes **other than pus-producing bacteria** [14]. Those causes include infectious agents, such as
  - ▶ “**atypical**” bacteria
  - ▶ (*Borrelia burgdorferi*,
  - ▶ *Leptospira* spp.,
  - ▶ *Mycobacteria*,
  - ▶ or *Treponema pallidum*),
  - ▶ fungi (such as *Cryptococcus neoformans*),
  - ▶ or a free-living amoeba (*Naegleria fowleri*).

# Mechanisms of virus migration through BBB

- 1- **viremia** develop
- 2- viruses can either **directly infect brain microvascular endothelium** or pass through them via transcytosis in endocytic vesicles
- 3- infection of **monocytes or macrophages** (diapedesis)  
“Trojan Horse” mechanism
- 4- **via inflammatory cytokine production** by viruses, **West Nile, HIV**
- 5- using **specialized proteins** [COVID-19 and Rabies virus
- 6- **directly** infect **glia** cells (part of the BBB), Nipah virus

# LP

## ► In immunocompetent patients

Without

- focal neurological abnormalities,
- prior neurosurgery,
- recent trauma,
- or papilledema,

**lumbar puncture** can be done **without** head **CT**  
first

# Suggests bacterial meningitis

- ▶ CSF not clear,
- ▶ increased opening pressure,
- ▶ WBC count  $> 500$  cells/mL  $>80\%$  of neutrophils,
- ▶ glucose CSF/blood ratio  $<0.4$ ,
- ▶ CSF protein  $> 1$  g/L,
- ▶ visible microorganisms

# Diagnosis

- CSF **lactic acid** above  $4.2 \text{ mmol/L}$  is also **strongly** associated with **bacterial** infection
  - Second LP
  - Eliza
  - PCR,...

# Viral suggested

- On the other hand , **CSF:**
- pleocytosis <300 cells/mL with lymphocytic predominance,
- clear fluid
- normal opening pressure,
- normal or only slightly decreased glucose,
- normal protein

**all suggest viral etiology**

# Encephalitis Etiology

- US 2000–2010, **unknown** etiology in **50%**
- **viral** etiologies (**48.2%**),
- HSV, *toxoplasma gondii*, and West Nile Virus, with co-morbid HIV present in 7.7% of hospitalizations.
- **Autoimmune** encephalitis among other specified causes was reported in **32.5%** of cases with **known** etiology ([George et al., 2014](#))

# In Mashhad,

- Detects 4 virus

- VZ

- Enterovirus

- HSV

- CMV

A decorative graphic on the left side of the slide. It features a dark grey arrow pointing to the right at the top. Below it, several thin, curved lines in shades of blue and grey sweep downwards and to the right, creating a sense of movement and flow.

# Our specialists believe

- diagnosis of arboviruses (CCHF, WNV, ...)
- is serologic base.

# HSV

- ▶ most common cause of sporadic encephalitis
- ▶ 90% HSV-1
- ▶ -----
- ▶ Initially similar bacterial meningitis with fever,  
headache,  
neck stiffness  
at extremes of age,  
focal seizures (temporal lobe abn)  
RBC in a non-traumatic tap

A dark grey arrow points to the right from the left edge of the slide. Below it, several thin, curved lines in shades of blue and grey sweep across the left side of the slide.

# New born HSV

:shock, status  
epilepticus, DIC,...

# HSV Tx

- ▶ High-dose IV acyclovir 14–21 days in immunocompetent and immunosuppressed patients, respectively
- ▶ ....significantly reduce mortality

# *HSV (CS& Acyclovir combination therapy)*

- ▶ limited clinical data for CS therapy
- ▶ benefit in **mouse**
- ▶ pre-clinical models, ,( **human study**)  
reduction in the severity of infection

▶

# HSV Tx cont,

- beneficial long-term effects,
- no increase in viral burden
- concern of potentially increasing viral replication

  - The Use of Adjunctive Steroids in Central Nervous Infections

# HSV<sub>1</sub> (C S & Acyclovir *combination therapy research*)

► Japan :

**beneficial** impact on clinical outcome and reduction in the extent of HSE infection, **without inhibition** of the **antiviral action** of acyclovir ([Kamei et al., 2005](#))

## (**C S & Acyclovir** combination therapy)

- ▶ Although corticosteroid adjunctive therapy must be studied further

Adjunctive **dexamethasone** might be considered for patients with HSV encephalitis and severe **brain edema** or **vasculitis**

# Viral Neural infection presentations

- stroke,
- mono neuropathies,
- polyneuropathies,
- Guillain-Barre syndrome
- myelitis,
- meningitis,
- encephalopathy,
- encephalitis,
- neuromyelitis optica,
- optic neuritis,
- Hemorrhagic encephalitis (AHLE),
- ADEM
- ANEC.

# West Nile Virus Encephalitis

- ▶ arthropod-borne infection that is most commonly transmitted by a mosquito bite
- ▶ virus **migrates to lymph tissue** and CNS
- ▶ Incubation 2 days to 14
- ▶ **80%** of cases remain **asymptomatic**, 20% have a febrile
- ▶ And wide spectrum CNS symptoms.
- ▶ no FDA approved vaccine
- ▶ CS therapy in controversy!

# PCR

- ▶ There are two **rapid multiplex PCR-based panel tests** on the market for the detection of multiple viral, bacterial, and fungal in CSF
- ▶ **In Iran** there is **rapid multiplex PCR-based panel tests** just for **TB**

# 2 type PCR

➤ **Traditional PCR** → electrophoresis → vision of protein bands

➤ **Real time PCR** is expensive the result following and observe with florescent and

the monitoring is completely by technology equipment.

Tests are:

- I. **Qualitative**
- II. **Quantitative** more expensive

➤ **rapid test** → Eliza objective , Hepatitis , Influanza. Covid..

# Encephalitis complications

today about,

- **ADEM**
- **AHLE**
- **ANEC**
- **Autoimmune Encephalitis**

# Cause of pediatric CNS demyelization

- ▶ include acute disseminated encephalomyelitis (ADEM);
  - ▶ multiple sclerosis (MS);
  - ▶ optic neuritis;
  - ▶ transverse myelitis;
  - ▶ myelin oligodendrocyte glycoprotein antibody-associated disease (MOGAD);
  - ▶ neuromyelitis optica spectrum disorder (NMOSD);
  - ▶ and various infectious, metabolic, and rheumatologic conditions
- 
- ▶ peripheral demyelization : GBS

# ADEM

- ▶ typically presents with [encephalopathy and multifocal brain lesions](#)
- ▶ often a [monophasic](#) illness with [good functional recovery](#)
- ▶ postulated to be an autoimmune disorder
- ▶ [demyelination](#) of [white matter](#) typically following a recent (1-2 weeks prior) viral infection or vaccination
- ▶ . [Grey matter](#) is also, as is the [spinal cord](#).

# ADEM cont,

- ▶ from a cross-reactivity in immunity to viral antigens, triggering a [subsequent autoimmune attack](#)
- ▶ half of all confirmed cases, [anti-MOG \(myelin oligodendrocyte glycoprotein\) immunoglobulin G antibodies](#)

## Markers:

### CSF

- ▶ pleocytosis
- ▶ show an increase in myelin basic protein
- ▶ anti-MOG antibodies

# ADEM cont,

- ▶ Some conditions can be fatal,
- ▶ including acute **hemorrhagic leukoencephalitis** (also known as Weston–Hurst syndrome) and
- ▶ **acute necrotizing encephalitis** of childhood

These have been associated with specific inciting infections and genetic mutations

# ADEM

## DDx

- ▶ [multiple sclerosis](#) or
- ▶ [neuromyelitis optica](#)
- ▶ 1-**Unlike MS**, symptoms are more systemic rather than focal and include fever, headache, decreased level of consciousness (varying from lethargy to coma), seizure, and multifocal neurologic symptoms including hemiparesis,  
lesion may demonstrate hemorrhage [AHLE \(Hurst disease\)](#)
- ▶ 2- ADEM Firstly with viral infection Sn& Sx
- ▶ **ADEM** progression to **MS** is not uncommon (35%).

# ADEM

- ▶ The International Pediatric Multiple Sclerosis Study Group defined ADEM as follows [\[21\]](#):
- ▶ A first polyfocal, clinical CNS event with presumed inflammatory demyelinating cause.
- ▶ Encephalopathy that cannot be explained by fever.
- ▶ No new clinical and magnetic resonance imaging (MRI) findings emerge  $\geq 3$  months after the onset.
- ▶ Brain MRI is abnormal during the acute (3-month) phase.

Which one is most similar to ADEM?

## ADEM

This young woman presented with progressive left hemiparesis after having had a viral infection a week earlier

bilateral asymmetric lesions with open ring enhancement characteristic of demyelination. Note that restricted diffusion is not seen centrally (usually seen in cerebral abscesses), but at the advancing rim of demyelination

# Brain abscess CT

# Cerebral abscess

# ADEM Tx

- ▶ Treatment typically consists of **methylprednisolone**, with **immunoglobulin** and **cyclophosphamide** reserved for patients **refractory** to steroids <sup>4</sup>.
- ▶ Monoclonal target antibody (in research)
- ▶ Recovery **1-3 mo**

# Hemorrhagic encephalitis(AHLE)

- ▶ closely mimic HSE in both CSF and in MRI
- ▶ **The absence of oligoclonal bands exclud fulminant MS .**
- ▶ difficult to Dx other causes of ADEM from AHLE based on clinical and MRI, diagnosis via biopsy.
- ▶ **rare ,fatal ,acute onset , hemorrhage in the white matter**
- ▶ **categorized in group of ADEM (progression to hemorrhage)**

A decorative graphic on the left side of the slide. It features a dark grey arrow pointing to the right at the top. Below the arrow, several thin, curved lines in shades of blue and grey sweep downwards and to the right, creating a dynamic, abstract background element.

## hemorrhagic encephalitis(AHLE)

- ▶ majority of the cases are the parietal lobes
- ▶ but the lesions can be seen in the subcortical white matter, mid brain, pons, corpus callosum, basal ganglia, medulla, cerebellum, and even spinal cord

# Acute necrotizing encephalopathy (ANEC)

- Children
- Genetic cause??
- rapidly progressive at first
- previously healthy child
- following a viral infection & viral Sx & Sx
- **symmetric** lesions in the basal ganglia, thalamus and brainstem, reminiscent of those seen in mitochondrial disorders, e.g. in Leigh syndrome or AHLE
- CSF pleocytosis is usually absent

**Figure 1(A and B):** (A) Axial FLAIR and (B) gradient echo (GRE) MR images at the level of basal ganglia show multifocal FLAIR hyperintense lesions at gray-white matter junction and in bilateral basal ganglia. None of the lesions shows evidence of hemorrhage (B)

**Figure 2 (A and B):** (A) Axial DWI MR image at the level of basal ganglia shows restricted diffusion within these lesions. (B) Contrast-enhanced T1W MR image shows peripheral rim enhancement of the lesions

# ANEC cont,

- ▶ etiology and the pathogenesis unclear
- ▶ most hypothesis is the **hypercytokinemia**---->**liver** dysfunction, acute **renal** failure, **shock**, and DIC
- ▶ development independent of the type of infectious agents.
- ▶ **edema to petechial hemorrhage and then to necrosis**
- ▶ familial episodes reported

# ANEC Tx

Not clear

- ▶ Immunotherapy

- ▶ IVIG

- ▶ 2022 Taiwan Pulse prednisolone plus IVIG with good outcome

A decorative graphic on the left side of the slide. It features a dark grey arrow pointing to the right at the top. Below the arrow, several thin, curved lines in shades of blue and grey sweep downwards and to the right, creating a sense of movement and design.

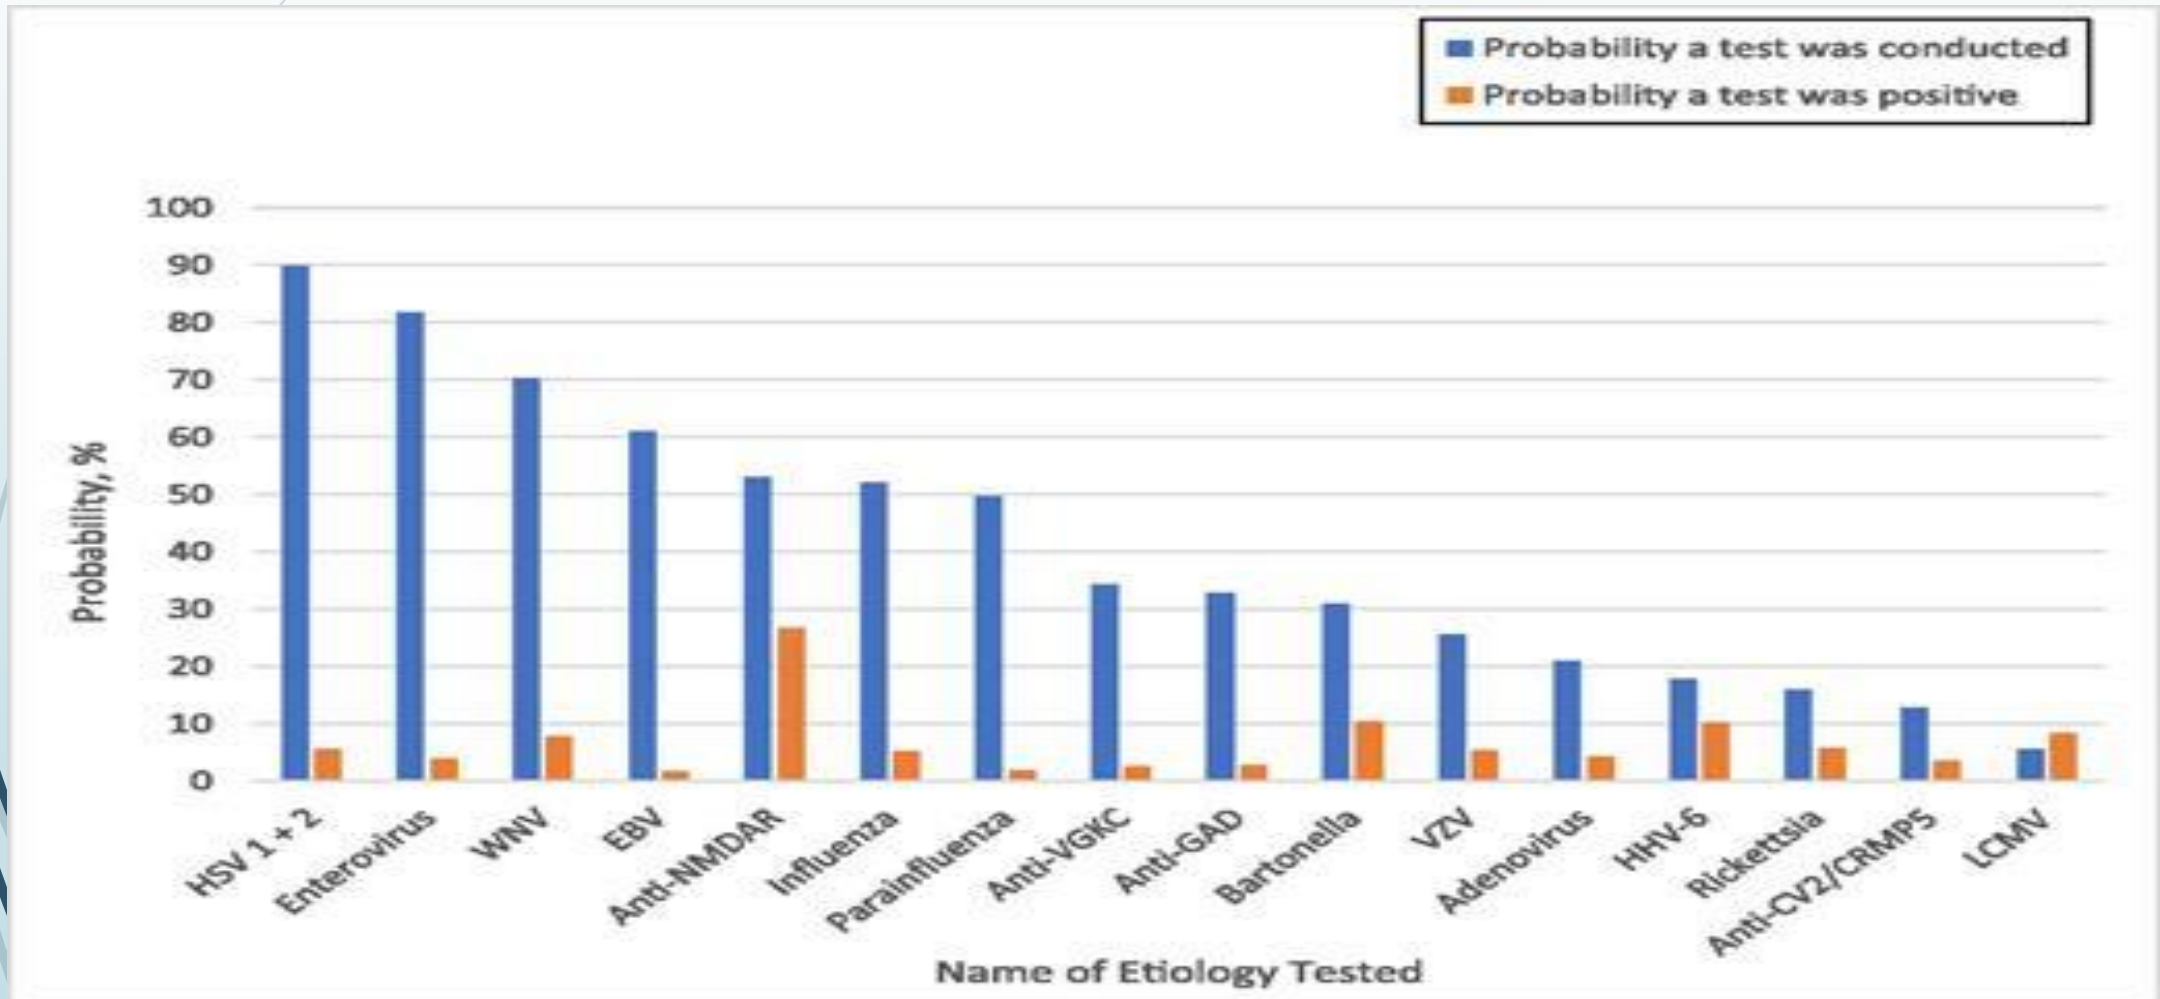

# Autoimmune encephalitis

- ▶ 20% of all cases of encephalitis,
  - ▶ **developed countries** it is more common
  - ▶ can follow viral **encephalitis** or **vaccinations**,
  - ▶ Be **paraneoplastic** (less in children) or cryptogenic
- 
- ▶ NMDA-R encephalitis is now more commonly identified
  - ▶ Female predominance
  - ▶ Young adult

# Infectious and Autoimmune Causes of Encephalitis in Children

American academy of pediatrics

A decorative graphic on the left side of the slide. It features a dark grey arrow pointing to the right at the top. Below the arrow, several thin, curved lines in shades of blue and grey sweep downwards and to the right, creating a sense of movement and design.

# autoimmune encephalitis

- **Early** immunotherapy, with either corticosteroids or IVIG, improves outcomes

can have a relapsing course

neurological deficits rather than psychiatric manifestations.

# autoimmune encephalitis

cont,

- ▶ Tumor is uncommonly identified in children; however, ovarian teratomas occur in about 30% of women younger than 18 years
- ▶ 94% lymphocytic pleocytosis (>5 CSF)
- ▶ EEG is abnormal 90%
- ▶ recovery up to **two** years after initial presentation.

# autoimmune encephalitis

**cont,**

- Long term Tx Rituximab, monthly IVIG, cyclophosphamide
- Prognosis is Good
- -----
- CSF -> often NL

# autoimmune encephalitis

## ➤ Dx cont,

➤ # csf Ab

➤ # blood Ab

➤ # MRI

➤ # Cn finding

➤ testing can take days to weeks to result,

➤ **empirical treatment is recommended for high index of suspicion**

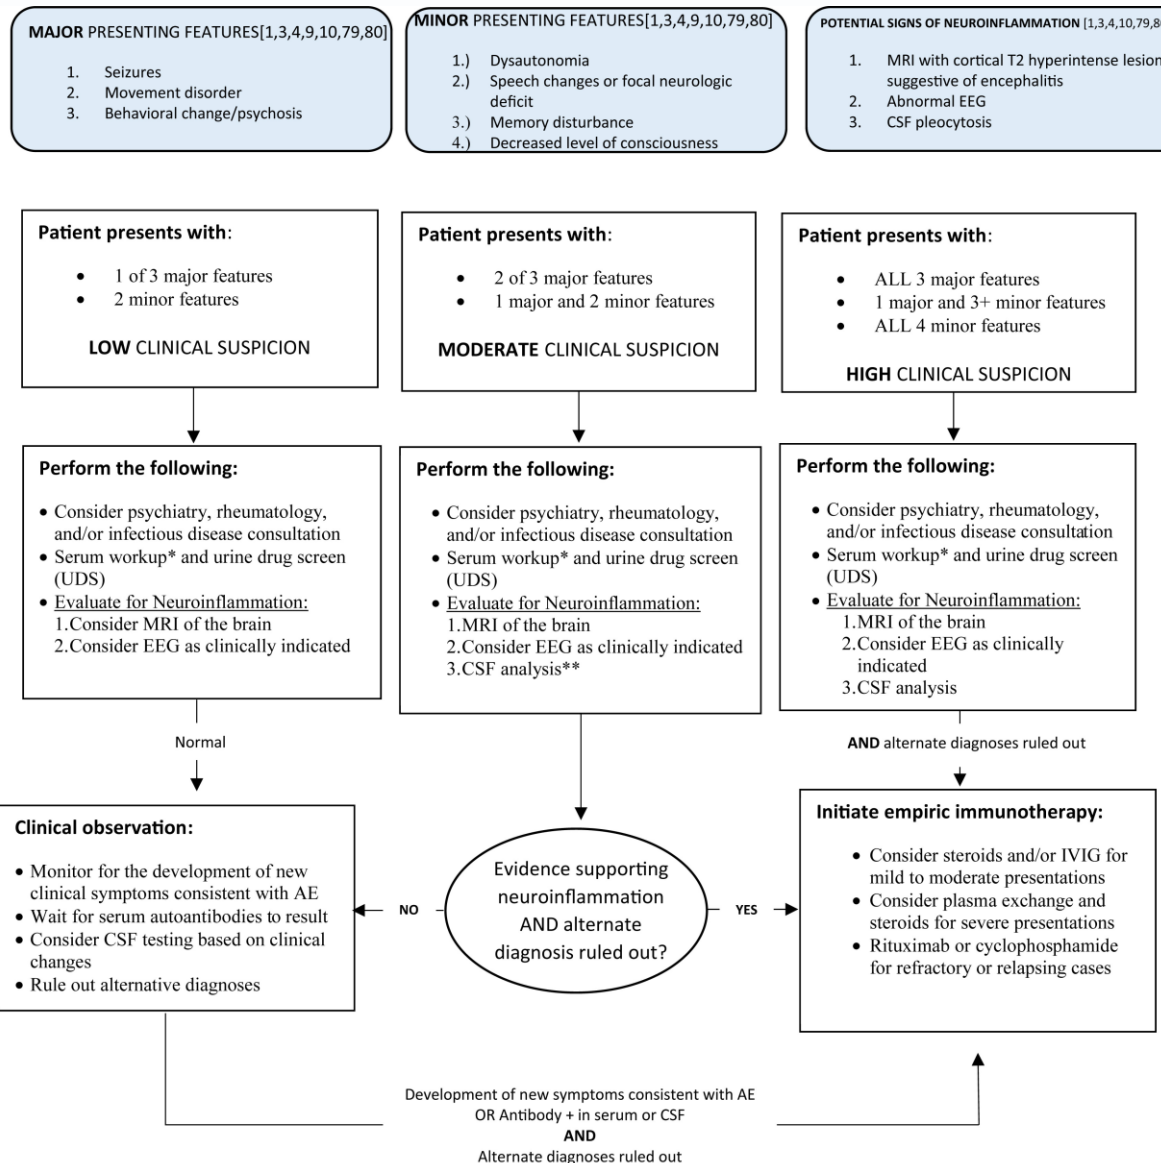

A dark grey arrow points right from the top left. Below it, several thin, curved lines in shades of blue and grey sweep across the left side of the slide.

▶ start empirical IVMP, IVIG, or PLEX

- ▶ Immunotherapy should be escalated to second-line therapies such as rituximab or cyclophosphamide in refractory cases.

# autoimmune encephalitis

# AE types

- ▶ **Leucine-rich, glioma-inactivated 1 (LGI-1) and contactin-associated protein-like 2 encephalitis**
- ▶ Cn is similar
- ▶ Rx: IVMP, IVIG, and/or PLEX with most children improving with immunotherapy
- ▶ **Glycine receptor antibody encephalitis**
- ▶ muscle rigidity, debilitating muscle spasms, and myoclonus
- ▶ Often nl MRI

# AE types

- ▶ **Gamma-aminobutyric acid type A & B receptor encephalitis**
- ▶ Some times tumor related
- ▶ **Ophelia syndrome**
- ▶ Hodgkin related
- ▶ good outcomes with tumor Tx
- ▶ **Myelin oligodendrocyte glycoprotein (MOG)**
- ▶ Myelin oligodendrocyte glycoprotein (MOG) is a myelin protein
- ▶ Behavior: is like ADEM, optic neuritis, and transverse myelitis
- ▶ 30% relaps ,
- ▶ more affect children
- ▶ Sometimes MOG Ab finded in patients with NMDA-R

# AE types

- ▶ **Hashimoto encephalopathy**

most common presenting symptoms in children include psychosis, confusion, abnormal movements, cognitive deterioration, and seizure.<sup>54</sup> Diagnostic criteria for HE in adults proposed by Graus et al. was based on clinical presentation; the presence of elevated anti-thyroid antibodies, namely, thyroid peroxidase antibodies and/or thyroglobulin antibodies; MRI findings; absence of well-characterized neuronal antibodies in the serum or CSF; and presence of subclinical or mild overt thyroid disease.<sup>55</sup> However, more recently, a study with 17 pediatric patients with HE revealed that adult diagnostic criteria lacked sensitivity when applied to children, given that the

# Some differences

- ▶ Hashimoto
- ▶ CSF → protein increasing
- ▶ Long term Tx → Rituximab
- ▶ majority of did not have thyroid disease.
- ▶ Px → good
- ▶ IVIG or PLEX with good effect.
- ▶ Rituximab had favorite outcome for relapsing

A dark grey arrow points to the right from the top left. Several thin, curved lines in shades of blue and grey originate from the left side and sweep across the slide, framing the text.

# AE types

- ▶ Rasmussen encephalitis
- ▶ unihemispheric focal cortical atrophy
- ▶ Tx: CS. IVIG.
- ▶ but definitive treatment remains surgical hemispherectomy

# Antibody-negative autoimmune encephalitis

- One of the more **difficult types** of AE

But

- Cn& pCn like AE
- had poorer cognitive outcomes at 1-year follow-up compared with children with NMDA-R encephalitis.<sup>79</sup> This study also demonstrated that postencephalitic epilepsy was more common

# AE

## Diagnostic approach

- ▶ discussions between neurologists, rheumatologists, psychiatrists, and infectious disease physicians. In children, the differential diagnosis includes infection, vascular etiologies, demyelinating disorders, metabolic and/or mitochondrial disorders, malignancies, drug intoxications, neurorheumatologic disorders, genetic leukoencephalopathies, and psychiatric disorders

- ▶

- ▶ Neuroimaging and EEG
- ▶ Tumor evaluation **F/U at least 2 y after**

# SARS-CoV-2

- ▶ SARS-CoV-2 virus infection symptoms are highly variable, and most infected people remain asymptomatic or only develop mild symptoms
- ▶ In symptomatic patients the respiratory and digestive systems involvement predominate.
- ▶ Multiple neurological complications have been reported

# Autoimmune Encephalitis

TOPICAL REVIEW [Volume 132](#) P56-66 July 2022

## Autoimmune Encephalitis in Children

[Duriel Hardy, MD](#) [Duriel.Hardy@austin.utexas.edu](mailto:Duriel.Hardy@austin.utexas.edu)

A dark grey arrow points to the right from the left edge of the slide. Several thin, curved lines in shades of blue and grey originate from the left side and sweep across the slide towards the right.

# Noninfectious meningitis

- ▶ Noninfectious meningitis can have an **autoimmune cause** triggered by certain medications [14], may be due to autoimmune diseases such as systemic **lupus** erythematosus, or can result from **malignant** invasion of the meninges

# Transverse myelitis

- ▶ is defined by inflammation of the spinal cord itself, which can be triggered either by viral invasion or by an autoimmune process
- ▶ It presents with acute or subacute symmetric motor and sensory deficits in extremities, usually in combination with neurogenic bowel and bladder dysfunction which can progress to respiratory muscle dysfunction, but without meningeal signs or encephalopathy.

# Rhombencephalitis

- Inflammation in the **brainstem** and, which can manifest as an onset of **ataxia** and **cranial nerve** abnormalities, followed by **hemodynamic instability** and **respiratory failure**

A dark grey arrow points to the right from the left edge of the slide. Several thin, curved lines in shades of blue and grey originate from the left side and sweep across the slide, some pointing towards the text.

# Tick-borne encephalitis

- ▶ virus can also cause encephaloradiculitis, where pain in radicular distribution is a prominent symptom
